Question 1 Correct Marked out of	A binary number is a combination of 1s and 0s. Its n th least significant digit is the n th digit starting from the right starting with 1. Given a decimal number, convert it to binary and determine the value of the the 4 th least significant digit.
P Flag question	Example
	number = 23
	- Convert the decimal number 23 to binary number: $23^{10} = 2^4 + 2^2 + 2^1 + 2^0 = (10111)_2$.
	The value of the 4 th index from the right in the binary representation is 0.
	Function Description
ß	Complete the function fourthBit in the editor below.
	fourthBit has the following parameter(s):
Y	int number: a decimal integer
	Returns.
	int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number.

Sample Case 1 Sample Input 1 STDIN Function 77 → number = 77 Sample Output 1 Explanation 1 Convert the decimal number 77 to binary number: $77_{10} = (1001101)_2$. The value of the 4th index from the right in the binary representation is 1. Answer: (penalty regime: 0 %) Reset answer

Answer: (penalty regime: 0 %)

Reset answer

```
* Complete the 'fourthBit' function below.
 3
     * The function is expected to return an INTEGER.
     * The function accepts INTEGER number as parameter.
 6
 7
    int fourthBit(int number)
 8
9 .
10
        int binary[32];
        int i=0;
11
        while(number>0)
12
13 .
            binary[i]=number%2;
14
            number/=2;
15
16
            1++;
17
18
            if(i>=4)
19 .
20
                return binary[3];
21
22
            else
23
            return 0;
24
```

	Test	Expected	Got	
~	printf("%d", fourthBit(32))	0	0	~
~	printf("%d", fourthBit(77))	1	1	~

Question 2	
Correct Marked out of	Determine the factors of a number (i.e., all positive integer values that evenly divide into a number) and then return the p th element of the list, sorted ascending. If there is no p th element, return 0.
P Flag question	Example
	n = 20
	p = 3
	The factors of 20 in ascending order are (1, 2, 4, 5, 10, 20). Using 1-based indexing, if p = 3, then 4 is returned. If p > 6, 0 would be returned.
	Function Description
	Complete the function pthFactor in the editor below.
	pthFactor has the following parameter(s):
	int n: the integer whose factors are to be found
	int p. the index of the factor to be returned
	Returns:
D	
	Constraints
	$1 \le n \le 10^{15}$

```
TZHZIN
Input Format for Custom Testing
Input from stdin will be processed as follows and passed to the function.
The first line contains an integer n, the number to factor.
The second line contains an integer p, the 1-based index of the factor to return.
Sample Case 0
Sample Input 0
STDIN Function
10 → n = 10
 3 \rightarrow p = 3
 Sample Output 0
 5
 Explanation 0
 Factoring n = 10 results in {1, 2, 5, 10}. Return the p = 3^{rd} factor, 5, as the answer.
  Sample Case 1
  Sample Input 1
```

$$5 \rightarrow p = 5$$

Sample Output 1

0

Explanation 1

Factoring n = 10 results in {1, 2, 5, 10}. There are only 4 factors and p = 5, therefore 0 is returned as the answer.

Sample Case 2

Sample Input 2

$$1 \rightarrow n = 1$$

$$1 \rightarrow p = 1$$

B

Sample Output 2

Factoring n = 1 results in $\{1\}$. The p = 1st factor of 1 is returned as the answer.

Answer: (penalty regime: 0 %)

    * Complete the 'pthFactor' function below.
    * The function is expected to return a LONG_INTEGER.
     * The function accepts following parameters:
     * 1. LONG INTEGER n
     * 2. LONG INTEGER p
9
10
   long pthFactor(long n, long p)
11
12
        int count=0:
13
       for (long i=1;i<=n;++i)
14 .
15
            if(n%i==0)
16 +
17
                count++;
18
                if(count==p)
19 .
20
                    return i;
21
22
23
24
        return 0:
25
```

		Test	Expected	Got	
	~	printf("%ld", pthFactor(10, 3))	5	5	~
	~	printf("%ld", pthFactor(10, 5))	9	0	~
	~	printf("%ld", pthFactor(1, 1))	1	1	~
